
LED DISPLAY INSTALLING INSTRUCTION

1. Installing Location

We need to know exactly where the led display is placed, then we will think about how to build up this led display, what should we note during installation, we also think about the display direction, the location surroundings, viewing distance, etc

2. Installing drawing and Design

After we know the situation of installing location, we will make out an installing drawing and design according to the details, the installing drawing includes structure design, structure materials, structure dimension, installing methods, required accessories, cables layout, etc, please kindly be noted that we will only prepare this file to you after receiving your order.

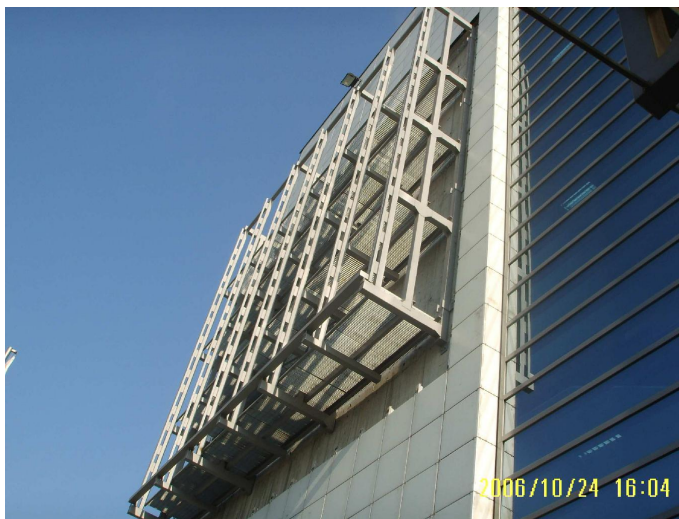

3. Location Check and Discussion

Usually we will send our engineer to our customers and help them to build led display up, our engineer will visit the installing location to check, and discuss with our customers about the installation, it is possible that a little change could happen, which is a little different from our original solution, which is allowed, but this is not going to effect our basic installing draw and design

4. Wall Installing

Metal structure attached the Wall
